

Flight Delay Analysis Report

1. Executive Summary

This report analyzes flight delay performance across selected airports.
The goal is to identify operational inefficiencies and provide actionable recommendations.

2. Data Overview

- Data Source: Flight records (Excel dataset)
- Key Fields:
 - Origin (Airport)
 - Departure Delay (DepDelay)

3. Analysis Results

Worst Performing Airport:

ESB

Average Delay:

27.5 minutes

4. Visualization

5. Insights

- ESB shows the highest average delay among all airports
- IST has moderate delay levels
- SAW demonstrates the best performance

6. Recommendations

- Investigate operational processes at ESB airport
- Analyze causes of delay (boarding, technical, congestion)
- Use SAW as a performance benchmark
- Consider process optimization strategies

7. Conclusion

ESB airport requires immediate attention due to significantly higher delay times. Improving operational efficiency in this location can enhance overall performance.
